PRESS RELEASE

New KUHN FB 3125 fixed baler stands out in reliability

KUHN introduces a new fixed chamber round baler: the FB 3125. With this model, the manufacturer completes its range with a high-performance machine designed for the farmer. The baler is a reliable solution for small- to mid-scaled farms producing their own baled forage. It performs in various crops and conditions, throughout the season. The operation is intuitive and simple to use whilst machine maintenance is made easy.

High bale density and capacity

18 high-quality rollers are at the core of the FB 3125 bale chamber. All rollers feature a POWERTRACK profile for maximum bale traction, resulting in a reliable bale start and a high bale density. The proven INTEGRAL ROTOR and wide 2.30 m pick-up provide a great crop flow for high-capacity baling. The FB 3125 bale chamber measures 1.22 x 1.25 metres.

Heavy-duty and maintenance-free components

The KUHN fixed chamber baler concept consists of robust components. All bale chamber rollers are laser-welded from a single component for maximum strength and performance. The FB 3125 also features a heavy-duty driveline and high-quality bearings to enhance machine durability and maintain bale shape and density. The baler is fitted with maintenance-free chamber rollers, and automatic chain lubrication to enable efficient machine maintenance.

An easy to operate machine

KUHN has designed the FB 3125 to be very easy and intuitive to use. With the VT 30 terminal, the operator is in control and has insight into the baling and binding processes. Important information such as bale growth, intake status, number of bales and number of net layers is provided at a glance. The baler only needs two hydraulic valves and a 3-pin connector to simplify the baling operation.

Perfect net bound bales

For constant high net tension, the KUHN net binding system provides active net stretch and consistent net spreading. Furthermore, convenient net positioning and a clear net routing makes for a simple roll exchange.
